$$M = F.d$$

$$M = 110 N.m$$

$$d = 32,5 \ mm = 0,0325m$$

$$F = \frac{110}{0,0325} = 3384,62 \text{ N}$$

A= 20mm²

$$\tau = \frac{F}{A}$$

$$\tau = \frac{3384,62}{20} = 169 \text{ MPa}$$

Supondo que a tensão se distribua por apenas 2 dentes:

$$\tau = \frac{169}{2} = 84 \text{ MPa}$$

Margem de segurança para o aço cromo vanádio 6150

$$Ms = 1 - \frac{\tau}{\tau s}$$

$$Ms = 1 - \frac{84}{858,75} = 0,9 = 90 \%$$

$$\tau = \frac{T * \rho}{J} \qquad \qquad J = \frac{\pi (c^4 - c_i^4)}{2}$$

$$J = \frac{3,14(27,5^4 - 20^4)}{2} = 6,47 \times 10^7$$

$$\tau = \frac{110 *27.5}{6.47 *10^7} = 4,67 MPa$$
